

Keycloak Deployment

Pre Requisites

- A running Kubernetes Cluster - either EKS or Minikube (**Note:** Minikube may cause some issues with port forwarding)
- Kubectl installed
- Helm installed
- Docker/Docker Desktop for Minikube
- An EBS Storage Class (AWS)

Overview

This configuration will deploy:

- a keycloak statefulset
- a postgresql statefulset and persistent volume

Steps

The following steps should be carried out within your Kubernetes environment, once authenticated to the cluster

1. Add the Bitnami Helm Repo

```
helm repo add bitnami https://charts.bitnami.com/bitnami
```

2. Create a new directory and add a values.yaml file

```
mkdir keycloak
cd keycloak
```

3. Customise the values.yaml file for initial key cloak deployment

Note: This will also pull default values from the bitnami/keycloak helm values. Additionally, you can configure more custom users.

```
global:
  storageClass: gp2
tls:
  enabled: true
  autoGenerated: true
auth:
  adminPassword: Test
postgresql:
  auth:
    password: test
    postgresPassword: test
```

4. Before deploying the helm chart, create a namespace in the cluster

```
kubectl create ns keycloak
```

5. Install the keycloak helm chart with custom values file in the new namespace.

Note: Make sure you are in the correct directory with the values.yaml file

```
helm upgrade --install keycloak bitnami/keycloak --values values.yaml -n keycloak
```

Instead of creating the values.yaml file, you could also declare all of these values in the helm install command e.g.

```
helm upgrade --install keycloak bitnami/keycloak --set tls.enabled=true --set tls.autoGenerated=true --set auth.adminPassword=Test --set po
```

6. Confirm that the deployment has been successful and check the logs. You should see a keycloak pod and a keycloak-postgresql pod running.

```
kubectl get pods -n keycloak
kubectl logs <name-of-pod> -n keycloak -f
```

Example of successful logs:

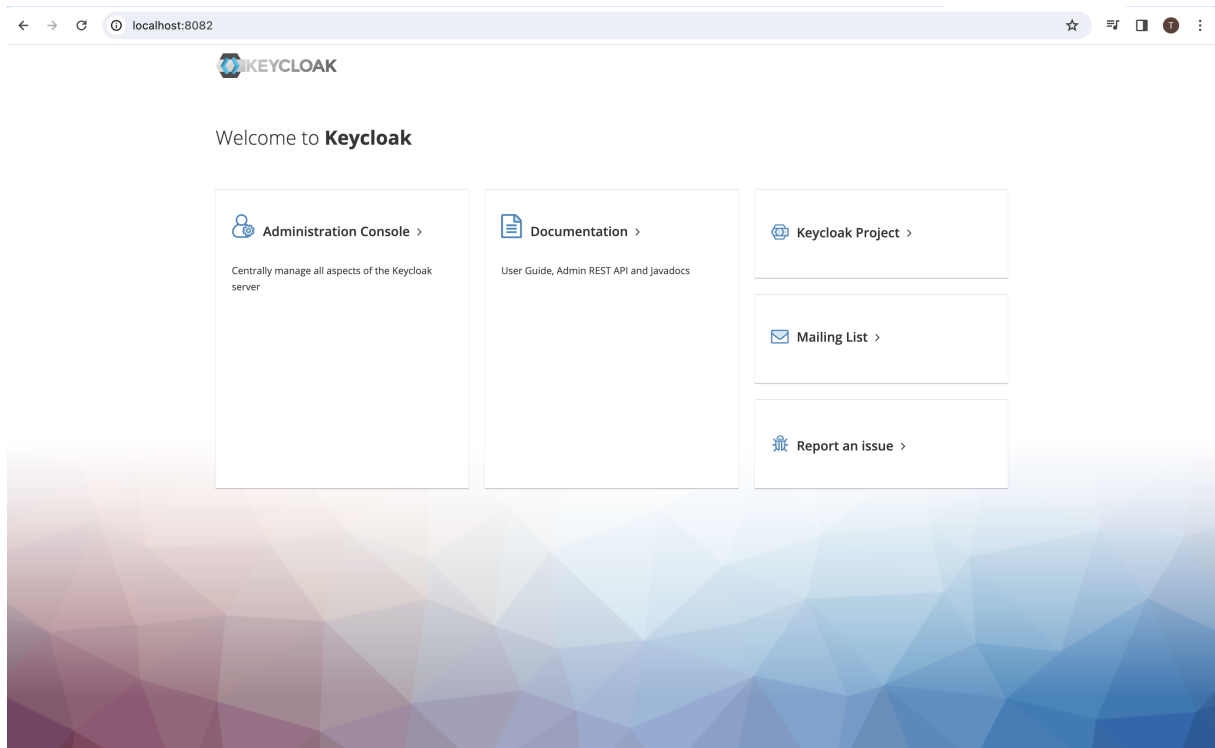

```
postgresql 10:00:21.38
postgresql 10:00:21.38 Welcome to the Bitnami postgresql container

2023-09-14 10:00:22.096 GMT [92] LOG:  database system was shut down at 2023-09-13 21:27:37 GMT
2023-09-14 10:00:22.309 GMT [1] LOG:  database system is ready to accept connections
2023-09-14 10:12:44.584 GMT [1] LOG:  received smart shutdown request
```

7. Lets port-forward the keycloak service to access the UI in a browser

```
kubectl get svc -n keycloak
kubectl port-forward svc/<keycloak-service> -n keycloak <port-to-expose>/80
```

8. Navigate to a browser and access `localhost:<port-to-expose>`

9. Go to Administration Console - it will prompt you for a username and password. The default username is **user** and we set the new password to **Test**.
Create a Realm.

KEYCLOAK

12. Create a new client - passing in rootURL. This port used here is the port where the application will be running.

The screenshot shows the Keycloak Admin Console interface for configuring a new client. On the left is a sidebar with navigation options: Manage, Clients (selected), Client scopes, Realm roles, Users, Groups, Sessions, Events, Configure, Realm settings, Authentication, Identity providers, and User federation. The main content area is titled 'node' with a sub-label 'OpenID Connect'. It includes a status toggle set to 'Enabled' and an 'Action' dropdown. Below this is a description: 'Clients are applications and services that can request authentication of a user.' There are five tabs: Settings (active), Roles, Client scopes, Sessions, and Advanced. The 'General Settings' section contains fields for 'Client ID' (node), 'Name' (test-client), and 'Description'. An 'Always display in UI' toggle is set to 'Off'. The 'Access settings' section includes 'Root URL' (http://localhost:3000), 'Home URL' (empty), and 'Valid redirect URIs' (http://localhost:3000/*) with a link to 'Add valid redirect URIs'. A 'Jump to section' sidebar on the right lists: General Settings, Access settings, Capability config, Login settings, and Logout settings. At the bottom are 'Save' and 'Revert' buttons.

13. Once created, you will need to export the json of the client from the Action tab > Export. This will download the client.json

This screenshot shows the same 'node' client configuration page, but with the 'Action' dropdown menu open. The menu options are: 'Download adapter config', 'Export' (highlighted), and 'Delete'. A file download notification at the top right indicates 'node.json' (1,316 B) has been downloaded. The 'General Settings' section shows the 'Client ID' as 'node'. The 'Jump to section' sidebar on the right shows 'General Settings' as the selected option.

```

{
  "clientId": "node",
  "name": "test-client",
  "description": "",
  "rootUrl": "http://localhost:3000",
  "adminUrl": "http://localhost:3000",
  "baseUrl": "",
  "surrogateAuthRequired": false,
  "enabled": true,
  "alwaysDisplayInConsole": false,
  "clientAuthenticatorType": "client-secret",
  "redirectUris": [
    "http://localhost:3000/*"
  ],
  "webOrigins": [
    "http://localhost:3000"
  ],
  "notBefore": 0,
  "bearerOnly": false,
  "consentRequired": false,
  "standardFlowEnabled": true,
  "implicitFlowEnabled": false,
  "directAccessGrantsEnabled": true,
  "serviceAccountsEnabled": false,
  "publicClient": true,
  "frontchannelLogout": true,
  "protocol": "openid-connect",
  "attributes": {
    "oidc.ciba.grant.enabled": "false",
    "oauth2.device.authorization.grant.enabled": "false",
    "backchannel.logout.session.required": "true",
    "backchannel.logout.revoke.offline.tokens": "false"
  },
  "authenticationFlowBindingOverrides": {},
  "fullScopeAllowed": true,
  "nodeReRegistrationTimeout": -1,
  "defaultClientScopes": [
    "web-origins",
    "acr",
    "profile",
    "roles",
    "email"
  ],
  "optionalClientScopes": [
    "address",
    "phone",
    "offline_access",
    "microprofile-jwt"
  ],
  "access": {

```

14. You will then need to integrate this json with the application programming language that you choose. The steps to do this is simple to replicate and can vary. Keycloak comes with client adapters for most popular languages including Node.js, Python, Java etc.
15. To avoid specifying the json in the values.yaml, we can create a Kubernetes secret for the realm json file and then mount the secret as a volume and get the value as a variable

Create Secret

```
kubectl create secret generic realm-secret --from-file=realm.json -n keycloak
```

Update values.yaml to allow pod access to the json

```
extraVolumes: |
- name: realm-secret
  secret:
    secretName: realm-secret

extraVolumeMounts: |
- name: realm-secret
  mountPath: "/realm/"
  readOnly: true

extraEnv: |
- name: KEYCLOAK_IMPORT
  value: /realm/realm.json
```

Conclusion

The final values file will look like this:

```
global:
  storageClass: gp2
tls:
  enabled: true
  autoGenerated: true
auth:
  adminPassword: Test
postgresql:
  auth:
    password: test
    postgresPassword: test

extraVolumes: |
- name: realm-secret
  secret:
    secretName: realm-secret

extraVolumeMounts: |
- name: realm-secret
  mountPath: "/realm/"
  readOnly: true

extraEnv: |
- name: KEYCLOAK_IMPORT
  value: /realm/realm.json
```

realm-export.json

```
